Re: Concrete Comparative Testing - Volumetric versus Drum Truck, Revision 1
Volumetric Mixer Manufacturing Bureau (VMMB) Project
Terracon Project No. 92101448

Dear Mr. Gaubert:

Terracon Consultants, Inc. (Terracon) is pleased to submit this letter report following completion of the Concrete Comparative Testing performed for Custom-Crete. The work was performed in general accordance with Terracon Proposal No. P92101132 dated August 17, 2010 and changes to the scope as agreed upon by Custom-Crete to the sampling frequency and number of compressive strength test specimens of concrete during the conference call on December 12, 2010. The finalized scope of work was authorized by Mr. Jerry Gaubert of Custom-Crete through execution of Terracon’s “Agreement for Services” signed December 9, 2010 and verbal confirmation of the scope changes during the conference call on December 12, 2010. It was informed to Terracon that Custom-Crete was facilitating this project on behalf of the Volumetric Mixer Manufacturing Bureau. Report presents our field and laboratory test data, as well as a discussion of the test results.

1.0 PROJECT INFORMATION

The purpose of this project was to compare concrete mix properties of similar plant batched ready-mix concrete from a volumetric versus a drum truck. The field and laboratory test results will be used to compare the two concrete mixing and delivery methods. The goal is to evaluate the efficiency of both methods. In this report, a discussion of the field and laboratory test results of three concrete mixes comprising of two volumetric and one drum mixed concrete during two separate placements is presented. Terracon submitted the test results from the concrete comparative testing through its report dated March 10, 2011.
2.0 SCOPE OF SERVICES

Our scope of services included field and laboratory testing:

2.1 Field Sampling and Testing

Terracon provided four ACI certified technicians to perform various tests to compare concrete mix properties for similar concrete mix designs, when batched from a volumetric versus a drum truck. Four technicians were assigned in groups of two to sample the concrete and perform the following field tests in accordance with Standard Practice for Sampling Freshly Mixed Concrete (ASTM C-172):

- Slump (ASTM C 143)
- Air Content (ASTM C 231)
- Unit Weight (ASTM C 138)

Custom-Crete was responsible for the batching, mixing and placement of the Ready-Mix concrete at their Brittmoore Road plant in Houston, Texas. Concrete was reported by Custom-Crete to be produced in accordance with ASTM C 685 and ASTM C 94. The concrete making materials (except for the water reducing admixture) for both the mixes were from the same sources. Upon batching and mixing, the ready-mix concrete was sampled by Terracon technicians from four different parts of the batch, including:

- 1st Quarter of the batch
- 2nd Quarter of the batch
- 3rd Quarter of the batch
- 4th Quarter of the batch

One drum truck and one volumetric truck was provided by Custom-Crete for the scheduled batching, mixing and placement operations. One set of 6 cylinder specimens were cast for each quarter of the batch for a total of 24 specimens for each mixing method.

Three concrete batches comprising of two volumetric and one drum truck, were placed on two separate placement dates. The first placement involved sampling one drum and one volumetric truck. The second placement was an additional test of the volumetric mixed concrete. The additional was required to address mix design differences in the volumetric and drum truck on the first placement. The difference between the two concrete mix batches was the use of water reducing admixture. The drum mixed concrete contained this admixture while the volumetric mixed concrete did not contain it. The second placement was also required to obtain a water to cement ratio that was similar for both the mixing methods.
2.2 Laboratory Testing
After 24 hours of initial field curing, cast test cylinders were transported to our laboratory for curing and subsequent testing for compressive strength testing in accordance with ASTM C39 and ASTM C617.

3.0 TEST RESULTS

The following section presents the field and laboratory testing results of concrete produced using drum and volumetric mixing methods.

3.1 Slump:
The concrete slump test results are presented in Table 1 and shown graphically in Figure 1. The slump was within the target range of 3 to 5 inches for the three concrete mixes produced.

<table>
<thead>
<tr>

</table>

1 Additional Test
3.2 Air Content:

The concrete air content test results are presented in Table 2 and shown graphically in Figure 2. The air content increased by a factor of about 3 following the addition of ASTM C494 Type A/F water reducing admixture (WR) in the concrete that was volumetric mixed.

3.3 Unit Weight:

The concrete plastic unit weight test results are presented in Table 3 and shown graphically in Figure 3. The unit weight of the volumetric mixed concrete (with water reducer) was lower by about 5 pcf in comparison to the drum mixed concrete. This can be contributed to the higher air content results observed for the same mix.

¹ Additional Test
Figure 3. Concrete Unit Weight Changes Within a Batch for Volumetric and Drum Mixed Concrete

3.4 Compressive Strength:

The concrete compressive strength test results are presented in Table 4 and shown graphically in Figure 4. The compressive strength on for the three mixes showed an increasing trend when compared to the age. The 28 day compressive strength of drum mixed concrete was lower compared to the volumetric mixed concrete specimens. However, this difference was less than 5 percent at 56 day test age.

$^1$ Additional Test

*This is an average of the compressive strength test results of specimens of all the four batches at the respective test age.
**The 28 day compressive strength test results are replaced by the 30 day test results as they appear to be an outlier. Refer to attached concrete test report 92101448.0001 Set#3 for Drum Mixed concrete and test report 92101448.0002 Set#4 for Volumetric Mixed concrete.**

![Concrete Compressive Strength Graph](image)

**Figure 4. Concrete Compressive Strength Versus Age for Volumetric and Drum Mixed Concrete**

3.5 Water/Cement Ratio:

The water/cementitious materials test results are presented in Table 5. Comparing the drum mixed and volumetric mixed (re-test) test results, the concrete produced using both the methods appears to be produced with the same w/c ratio.

<table>
<thead>
<tr>
<th>Mixing/Production Method</th>
<th>Drum Mixed</th>
<th>Volumetric Mixed w/o WR</th>
<th>Volumetric Mixed w/WR¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water/Cementitious Ratio</td>
<td>0.57</td>
<td>0.68</td>
<td>0.57</td>
</tr>
</tbody>
</table>

¹ Additional Test

*This is an average based on the total water added to the concrete during the production of the entire concrete batch. The water/cementitious ratio may be higher than the average reported for the entire batch. This is due to the fact that water was added during mixing based on visual evaluation of the concrete consistency. The water/cement ratio was calculated by Custom-Crete and reported to Terracon.*
4.0 DISCUSSION AND CONCLUSIONS

Based on the field and laboratory test results presented in Section 3.0 of this report, it appears that the compressive strength of the concrete shows an increasing trend over a period of 56 days in both the production methods. At any of the three test ages, the concrete produced using the volumetric method had a marginally higher strength gain compared to the concrete produced by a drum truck using similar materials and about the same water/cement ratio.

The water/cement ratio of the volumetric mix produced concrete without any water reducing admixture was higher compared to the similar volumetric mix produced with the water reducing admixture. The higher water/cement ratio resulted in a little reduction in the compressive strength when compared to the volumetric mix with a water reducer. However, even with the lower water/cement ratio, the strength gain was higher compared to the drum mixed concrete at the same test ages.

There was a threefold difference in the air content of concrete produced using volumetric mixing and that of drum mixed concrete. This may be attributed to the use of different make water reducing admixtures and its chemistry with the cement of the concrete. The higher air content of the volumetric mixed concrete with water reducer did not lead to a reduction in the compressive strength when compared to the results of the same mix in a drum mix truck.

The slump of concrete batches produced using both methods was between 3 to 4.5 inches.

Based on the field and laboratory test results, it appears that the volumetric and drum mix production methods produce similar results when similar materials are used to produce a concrete within a specified slump, air content and water/cement ratio.

The efficiencies of using either of the production methods is a question of its practicality of use on a particular project.

5.0 LIMITATIONS

The analysis and opinions presented in this report are based upon the information provided to us by Custom-Crete, together with our field and laboratory test data. While additional conditions may exist that could alter our conclusions, we feel that reasonable means have been made to evaluate the concrete materials.

This report has been prepared for the exclusive use of Custom-Crete for specific application to the project discussed and has been prepared in accordance with generally accepted engineering practices using the standard of care and skill ordinarily exercised by professional engineers practicing in this area, for a project of similar scope and nature. No warranties, either express or implied, are intended or made. It is possible that defects and/or deficiencies exist that were not readily accessible or visible. Problems may develop with time, which were not evident at the time of this assessment. The opinions and recommendations in this report should
not be construed in any way to constitute a warranty or guarantee regarding the current or future performance of any system identified. In the event that information described in this document which was provided by others is incorrect, or if additional information becomes available, the conclusions and recommendations contained in this report shall not be considered valid unless Terracon reviews the information and either verifies or modifies the conclusions of this report in writing.

It was our pleasure to work with you on this project and provide our services. We hope our report is responsive to your needs. If you have any questions regarding this report, please do not hesitate to contact us.

Sincerely,
Terracon Consultants, Inc.
